I show you here a number of such dried hydrosols (demonstration). They are, as you see, mostly dark colored scales which are readily soluble in water (demonstration). 18. In addition to the methods of coagulation brought about through the addition of different substances, others are known in which radiant energy, as from radium emanations, is active. Coagulation may also be brought about through exposure to light, through shaking with charcoal, with Fuller's earth, or with other powders, and through the addition of non-miscible liquids. Thus, many colloids, including the proteins, may be separated almost completely from their dispersion media by being shaken for long periods of time with benzol or petroleum. Moreover, when egg white is beaten to a foam, a part is regularly coagulated in the walls enclosing the air bubbles. A decrease in degree of dispersion to the point of inducing coagulation can also be brought about through centrifuging, etc. These belong to the mechanical methods of producing coagulation. Certain details of the way in which these different methods produce their effects will be discussed later. 19. The reverse of coagulation, namely, peptization, may also be brought about by the most diverse chemical, electrical and mechanical means. Coagulated gels, for instance, may again be brought to a state of colloid dispersion through treatment with weak acids or bases, as will be shown in the next lecture. Of special importance are the peptization phenomena in which an increased dispersion is brought about...
